Product description:

TNT Trash Buster, which contains our Hi-Energy Fish, is uniquely formulated to stimulate the soil organisms that help break down crop residues, which can help cycle nutrients, improve soil structure and drainage, improve the soil's water retention capacity and increase soil organic matter content. It is especially useful in no-till situations or where heavy crop residues are likely to interfere with future equipment passes and can even be used to stimulate compost pile activity. TNT Trash Buster is made of ingredients approved for organic use. This product is suitable for organic or conventional systems and can be used any time after the residue is on the ground or when compost is being stacked or turned.

DIRECTIONS for USE:

Some settling may occur after extended periods of storage. Always mix/stir thoroughly before use. The product has been filtered at the time of manufacture; however, separate filtration for critical systems should be used to avoid plugging of very small orifices. Do not store diluted product in equipment—use all that you mix within 8 hours. Incorporation of residue after application is not necessary but will speed up activity.

STORAGE:

Store out of direct sunlight. Freezing will not damage the product but will amplify the separation of components and settling, resulting in additional effort to thoroughly blend the product again before use.

CAUTION:

Keep away from children and animals. Not intended to be taken internally.

NOTICE:

Seller warrants that product conforms to its chemical description and is reasonably fit for the purpose stated on this label when used in accordance with directions under normal conditions of use. Since weather, crop and soil conditions vary, TNT Farming Solutions and the seller make no warranty of any kind, expressed or implied, concerning the use of this product. User assumes all risks of use and handling, whether or not following directions or suggestions.
